

ABSTRACT

A film which may be a tape with a glue or a film with electrostatic cling properties and which is transparent, translucent, or opaque has an identifying

5 indicia thereon in a pattern arranged such that the leading edge of the tape or film whether on the roll or separated from the roll in sections and used to wrap an item such as electrical tape for use in an electrical conductor splice is readily identified by misregistration of overlapping indicia at the leading edge with the next adjacent juxtaposed layer. Spliced conductors can also have their polarity identified by the

10 color of the indicia.
